## Multigrid for solving complex-valued Helmholtz problems

Isidoor Pinillo Esquivel

November 8, 2023

## 1 Failure of the Multigrid method for Helmholtz problems: analysis

## 1.1 Discretization

(a)

$$10 \le \lambda \text{ \#gridpoints} \Leftrightarrow$$

$$10 \le \frac{2\pi}{\sqrt{|\sigma|}} \frac{1}{h^d} \Leftrightarrow$$

$$\sqrt{|\sigma|} h^d \le \frac{2\pi}{10} \approx 0.625.$$

(b)

# roosterpunten = 
$$\frac{10\sqrt{600}}{2\pi}$$
.

## 1.2 1D model problem

(a

To proof:  $H^{2h} \neq I_h^{2h} H^h I_{2h}^h$ .

$$H^{2h} = H_n = A_n + \sigma i d_n$$
  
$$H^h = H_{2n} = A_{2n} + \sigma i d_{2n}$$

Assume that  $A_n = I_h^{2h} A_{2n} I_{2h}^h = R_{2n} A_{2n} I_n$ . By linearity it is sufficient to proof:

$$\sigma i d_n \neq \sigma R_{2n} i d_{2n} I_n \Leftrightarrow$$

$$i d_n \neq R_{2n} I_n \Leftarrow$$

$$(i d_n)_{00} = 1 \neq \frac{3}{4} = (R_{2n} I_n)_{00}$$

First equivalence follows from  $\sigma \neq 0$ . The assumption and the last inequality depends on the definition of restriction and interpolation. (b) See code/main.ipynb for code and plots.

(c)

There exists a closed formula for eigenvalues and eigenvectors of tridiagonal toeplitz matrix. It is just tedious to use. Alternatively the eigenvalues and eigenvectors can be derived from the Poisson problem ( $\sigma = 0$ ) because

$$Av = \lambda v \Rightarrow$$

$$(A + \sigma id)v = Av + \sigma v$$

$$= (\lambda + \sigma)v$$

i.e. eigenvectors stay the same and eigenvalues get shifted by  $\sigma$ .

(d) See code/main.ipynb for the plot.  $\sigma = 0$  is the boundary where H goes from indefinite to definite.
